

BuildCycle + Procore — Design-Team Construction Administration (RFIs & Submittals)

TARGET PERSONAS

- Project Architect (prime)
- Consultant Engineer
- GC Project Manager / Engineer

USER STORY & INTEGRATION VALUE

Usecase: Design-team RFI & submittal response workflow.

User Story: As a Project Architect, I receive my projects' Procore RFIs and submittals inside BuildCycle automatically, route each to the right consultant by discipline, review their answer, and approve it — and my approved response posts back to Procore as the formal reply, with attachments, advancing ball-in-court for the GC without anyone re-keying anything.

Integration Value Proposition: This integration eliminates the design-side data silo that slows construction administration. Architects and their consultants work in a CA-native platform; Procore receives complete, formal responses (not comments) the moment they are approved. The GC's record stays current and authoritative — BuildCycle never modifies Procore item status, which remains GC-owned — and both teams keep one shared, auditable history without duplicate entry.
